

Engis Latest Vitrified Diamond and CBN Wheels at Manufacturing Solutions Ireland Event

Engis UK, specialist in superabrasive grinding, finishing and lapping machines and consumables, is showing (stand 11) its latest vitrified diamond and CBN wheels at the joint LIT & GTMA Manufacturing Solutions show being held at the Limerick Institute of Technology on 24 May.

Although Vitrified Superabrasive products are not totally new to the market, they have previously proved difficult to dress, needing special machinery or to be returned to the manufacturer to be “opened up”.

However, the new breed of Vitrified wheels from Engis are as easy to dress as conventional resin diamond/CBN wheels, while offering the added advantages of speed, depth of cut, production life and corner holding.

Engis will also be showing electroplated products and Minimo polishing and deburring systems as well as a selection of its extensive range of lapping and polishing compounds, and, of course, Engis technical staff will be on hand to answer visitors' queries about the products and their application.
