

Simplified import of parts lists in the HASCO portal

HASCO, the leading manufacturer of standardised quality mould units and customised hot runner systems, has improved the ordering process in its online portal www.hasco.com even further and made it as simple as possible.

Simplified CSV structure enables rapid import of parts lists

The given CSV structure to transfer parts lists from the customer's CAD system to the HASCO portal has been made significantly easier. Item numbers and references are, with immediate effect, transferred directly to the shopping cart.

Unambiguous allocation of the products on receipt by the customer

The individual identification of the article packaging in the HASCO logistics centre ensures even easier allocation of the products on receipt of the goods by the customer. The labelling also allows continuous tracking of all data from the design process to the building of the injection moulding tool. Through the simplified import of the parts list and the consistent deployment of standardised quality mould units, considerable time and cost savings can already be achieved during the ordering process.
